THE AUTHORS

WILLIAM H. McLAIN is a forester in the Interior West Resource Inventory, Monitoring, and Evaluation Program at the Intermountain Research Station. His primary area of responsibility is inventory and special projects. He holds a B.S. degree in forestry from Oklahoma State University, Stillwater, and has done graduate work in economics at Weber State University, Ogden, UT. He began his Forest Service career in 1968 with the Intermountain Station.

CHARLES E. KEEGAN III is the director of Forest Industry Research, Bureau of Business and Economic Research, and associate professor of management, School of Business Administration, University of Montana, Missoula, MT. He holds a B.S. degree in business administration from Georgetown University and a Master of Science degree in forestry from the University of Montana.

DANIEL P. WICHMAN is a research assistant for the Bureau of Business and Economic Research, University of Montana, Missoula, MT. He holds a B.S.

degree in forestry and a Master of Business Administration degree from the University of Montana.

ACKNOWLEDGMENTS

We thank the owners and operators of Montana's primary wood processing plants for supplying data for this report.

RESEARCH SUMMARY

Montana's timber production in 1988 was 237.3 million cubic feet (1,232.6 million board feet, Scribner rule), up 8 percent from 1981. Sawlog production was 189.5 million cubic feet (1,000.0 million board feet). Veneer log volume was 38.9 million cubic feet (205.3 million board feet). Lodgepole pine comprised 29 percent, Lincoln county 26 percent, and National Forest lands 40 percent of the harvest. Mill residue volume was 183.6 million cubic feet, 91 percent of which was used, most for pulp chips, board fiber, or industrial plant fuel.

Montana's Timber Production and Mill Residue, 1988

William H. McLain
Charles E. Keegan III
Daniel P. Wichman

INTRODUCTION

This bulletin reports the estimated timber production and mill residue of Montana in 1988, coinciding with the year of forest inventory.

The Bureau of Business and Economic Research at the University of Montana (Missoula) canvassed primary wood processing plants to collect the data for this bulletin (tables 1 through 20). Resident mills and those located outside Montana that consumed timber products (industrial roundwood) originating in Montana were contacted. Mill operators were asked to supply information about the timber they used during 1988. This information included the volume, species, product type, ownership and county of origin of timber products, and an estimate of mill residue volume by type.

The appendix includes the conversion factor table.

TIMBER PRODUCTION

In 1988, Montana's timber production, which does not include fuelwood, was 237.3 million cubic feet, up almost 8 percent from 1981's 220 million cubic feet (fig. 1). Sawlogs continued to be the dominant product (tables 1 through 9), accounting for 80 percent of the volume of all industrial roundwood harvested. The 1988 sawlog harvest volume represents an 18 percent increase over the level in 1981 (fig. 2). The reported volume of veneer logs was 38.9 million cubic feet, down 2.1 million cubic feet from 1981. Production of other timber products such as posts and poles, house logs, round pulpwood, and cedar logs was 8.9 million cubic feet. Lodgepole pine (*Pinus contorta*) made up 29 percent of the harvest (tables 1-3, 10-12, 16-18, fig. 3), followed by Douglas-fir (*Pseudotsuga menziesii*), 27 percent, ponderosa pine (*Pinus ponderosa*), 16 percent, and western larch (*Larix occidentalis*), 14 percent. Live trees provided 93 percent (220.9 million cubic feet) of the timber production. When timber products from live trees were considered, Douglas-fir was most common, 63.4 million cubic feet (29 percent of timber production from live trees), followed by lodgepole pine, 56.1 million cubic feet (25 percent). Of the 16.4 million cubic feet of timber products from dead trees,

Figure 1—Montana's timber production by selected years (Setzer 1971; White and others 1980; Keegan and others 1983).

Figure 2—Montana's timber production by product for selected years (Setzer 1971; White and others 1980; Keegan and others 1983).

Figure 3—Volume by species in million cubic feet, Montana, 1988.

12.7 million cubic feet (77 percent) was lodgepole pine and 2.5 million cubic feet (15 percent) was ponderosa pine. Growing-stock removals associated with the timber harvest were 248.2 million cubic feet; sawtimber removals were 1,131.6 million board feet, Scribner rule, or 1,328.6 million board feet, International 1/4-inch rule (McLain in preparation).

Lincoln County provided 26 percent of Montana's harvest, followed by Flathead (20.6 percent), Missoula (11.3 percent), Sanders (7.2 percent), and Lake (4.6 percent) (tables 7-15, fig. 4).

An estimated 40 percent of the timber products harvested in 1988 came from National Forest lands (tables 4-6 and 13-18). Forest industry lands provided 32 percent of the harvest, and other private lands provided 19 percent.

MILL RESIDUE

An estimated 183.6 million cubic feet of mill residue was produced in 1988 (table 20). Ninety-one percent of this residue was used, most as pulp chips, board fiber, or industrial fuel (tables 19 and 20).

TERMINOLOGY

Bone dry unit—2,400 pounds.

Coarse residue—That part of sawmill or mill residue suitable for chipping, such as slabs, edgings, and trimmings.

Fine residue—That part of sawmill or mill residue finer than coarse residue, consisting of sawdust and shavings.

Growing-stock trees (in this publication)—Sawtimber trees and poletimber trees. These are live trees of timber species that meet specified standards of size, quality, and vigor; excludes cull trees, nontimber tree species, and dead trees. See *sawtimber trees* and *poletimber trees*.

Growing-stock volume—Net cubic-foot volume in growing-stock trees (poletimber and sawtimber) from a 1-foot stump to a minimum 4-inch top (of central stem) diameter outside bark or to the point where the central stem breaks into limbs.

Industrial wood products—All timber products except fuelwood.

Logging residue—The unused growing-stock or sawtimber volume of trees cut or killed by logging and left in the woods.

Mill residue—Wood material from primary manufacturing plants not utilized for the mill's primary product. Includes bark, slabs, edgings, trimmings, miscuts, sawdust, and shavings.

Poletimber trees—Live trees of timber species, at least 5-inches diameter at breast height (d.b.h.) but smaller than sawtimber size, containing at least one 8-foot bolt, and more than one-third sound.

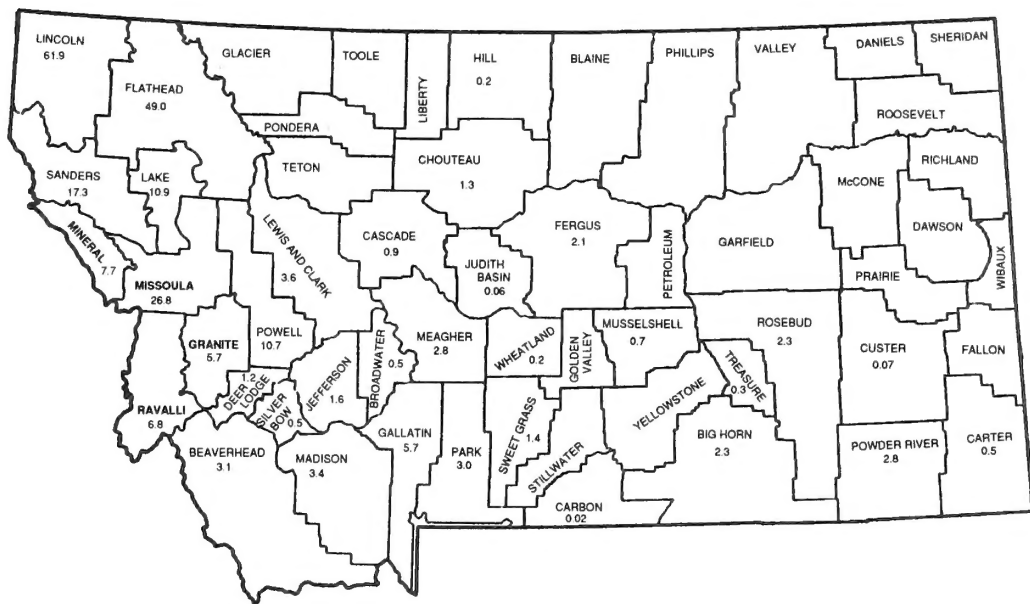

Figure 4—Timber production by county in million cubic feet, Montana, 1988.

Removals (in this publication)—The growing-stock and sawtimber volume removed from the inventory by harvesting. Consists of logging residue and the growing-stock and sawtimber volume of products.

Sawlog portion—That part of the bole of sawtimber trees between a 1-foot stump and the sawlog top.

Sawlog top—The portion on the bole of sawtimber trees above which a sawlog cannot be produced. The minimum sawlog top is 7-inches diameter outside bark (d.o.b.) for softwoods and 9-inches d.o.b. for hardwoods.

Sawtimber product volume—The sawtimber volume in timber products.

Sawtimber removals (in this publication)—The sawtimber volume removed from inventory by harvesting. Consists of logging residue and the sawtimber volume of products.

Sawtimber trees—Live trees of timber species meeting regional size and defect specifications. Softwood trees must be at least 9-inches d.b.h. and hardwood trees at least 11-inches d.b.h.

Sawtimber volume—Net volume in board feet of the sawlog portion of live sawtimber trees.

Timber production—The harvested volume of timber products. Also called industrial roundwood production or industrial wood production. Timber products or industrial roundwood (products) refer to logs, bolts, or other round sections cut from trees for industrial or consumer use and delivered “in the round” as logs or bolts to sawmills, plants, or yards. In this report, the term “timber products” does not include fuelwood. Included are sawlogs, veneer logs, pulpwood, utility poles, corral

poles and posts, house logs, and fiber logs. Mine timbers and landscaping timbers would have been included if they had been reported as harvested.

¹Material suitable for chipping, such as slabs, edgings, and trim.²Sawdust and planer shavings.

Table 20—Estimated volume, in thousand cubic feet¹, of used and unused residue from mill operations in Montana, 1988

Residue	Product			Total used	Unused	Total produced
	Pulp and boards	Plant fuel	Other			
----- <i>Thousand cubic feet</i> -----						
Bark	—	33,408	2,592	36,000	5,856	41,856
Coarse ²	79,392	4,416	—	83,808	2,688	86,496
Fines ³	31,392	16,608	96	48,096	7,200	55,296
Total	110,784	54,432	2,688	167,904	15,744	183,648

¹Residue data were reported in bone dry units (Keegan and others n.d.). A BDU/cubic feet conversion factor was unavailable; however, Cunit conversions were available for both pounds and cubic feet. BDU's were converted to cubic feet as follows:

1 bone dry unit = 2,400 pounds (ovendry weight)

1 Cunit = 2,500 pounds (ovendry weight) = 100 cubic feet

Therefore:

$$1 \text{ bone dry unit} = \frac{2,400}{2,500} \times 100 = 96 \text{ cubic feet.}$$

²Material suitable for chipping, such as slabs, edgings, and trim.

³Sawdust and planer shavings.

APPENDIX: CONVERSION FACTORS

Table 21—Conversion factors used in preparing volume figures for this report

Product	Cords	Piece	Cubic feet	Board feet	
				Scribner rule	International 1/4-inch rule
Sawlogs and other roundwood ¹	—	—	1.000	5.277	6.201
Sawlogs and other roundwood ¹	—	—	—	1.000	1.175
Pulpwood ²	1	—	63.167	333.333	391.666
Pulpwood ²	—	—	1.000	5.277	6.201
Utility poles ³	—	1	—	93.000	—
Posts ³	—	1	1.017	—	—

Mill residues

Mill residue reported in Bone Dry Units (BDU's) and converted to cubic feet as follows:

1 bone dry unit = 2,400 pounds (ovendry weight)

1 Cunit = 2,500 pounds (ovendry weight) = 100 cubic feet

Therefore:

$$1 \text{ bone dry unit} = \frac{2,400}{2,500} \times 100 = 96 \text{ cubic feet.}$$

¹Veneer logs, house logs, and cedar products. From logging utilization data collected on active logging operations in Montana in 1988.

²Round pulpwood was reported in mixed units. These units were converted to cords. Cords were converted to thousand board feet (Scribner rule) using 3 cords/thousand board feet. Conversions from thousand board feet (Scribner rule) to thousand board feet (International 1/4-inch rule) and thousand cubic feet used the same factors as were used for sawlogs.

³Utility poles, posts, and rails. Cubic and board-foot (Scribner rule) volumes computed from actual dimensions. Board-foot (International 1/4-inch rule) volumes derived from 1 board foot (Scribner rule) equals 1.175 board feet (International 1/4-inch rule). Posts and poles with small-end diameters less than 6 inches have 0 board feet.

McLain, William H.; Keegan, Charles E., III; Wichman, Daniel P. 1992. Montana's timber production and mill residue, 1988. Resour. Bull. INT-77. Ogden, UT: U.S. Department of Agriculture, Forest Service, Intermountain Research Station. 17 p.

Reports 1988 timber production estimates for Montana by county, species, owner, and product. Also reports estimates of mill residue by use. Data were obtained by canvassing Montana's primary wood processors and out-of-State mills receiving logs harvested in Montana.

KEYWORDS: timber products output, sawlog production, roundwood, forest products, logging, growing-stock, sawmilling, primary conversion

The Intermountain Research Station provides scientific knowledge and technology to improve management, protection, and use of the forests and rangelands of the Intermountain West. Research is designed to meet the needs of National Forest managers, Federal and State agencies, industry, academic institutions, public and private organizations, and individuals. Results of research are made available through publications, symposia, workshops, training sessions, and personal contacts.

The Intermountain Research Station territory includes Montana, Idaho, Utah, Nevada, and western Wyoming. Eighty-five percent of the lands in the Station area, about 231 million acres, are classified as forest or rangeland. They include grasslands, deserts, shrublands, alpine areas, and forests. They provide fiber for forest industries, minerals and fossil fuels for energy and industrial development, water for domestic and industrial consumption, forage for livestock and wildlife, and recreation opportunities for millions of visitors.

Several Station units conduct research in additional western States, or have missions that are national or international in scope.

USDA policy prohibits discrimination because of race, color, national origin, sex, age, religion, or handicapping condition. Any person who believes he or she has been discriminated against in any USDA-related activity should immediately contact the Secretary of Agriculture, Washington, DC 20250.
